

Day 1 : VPC

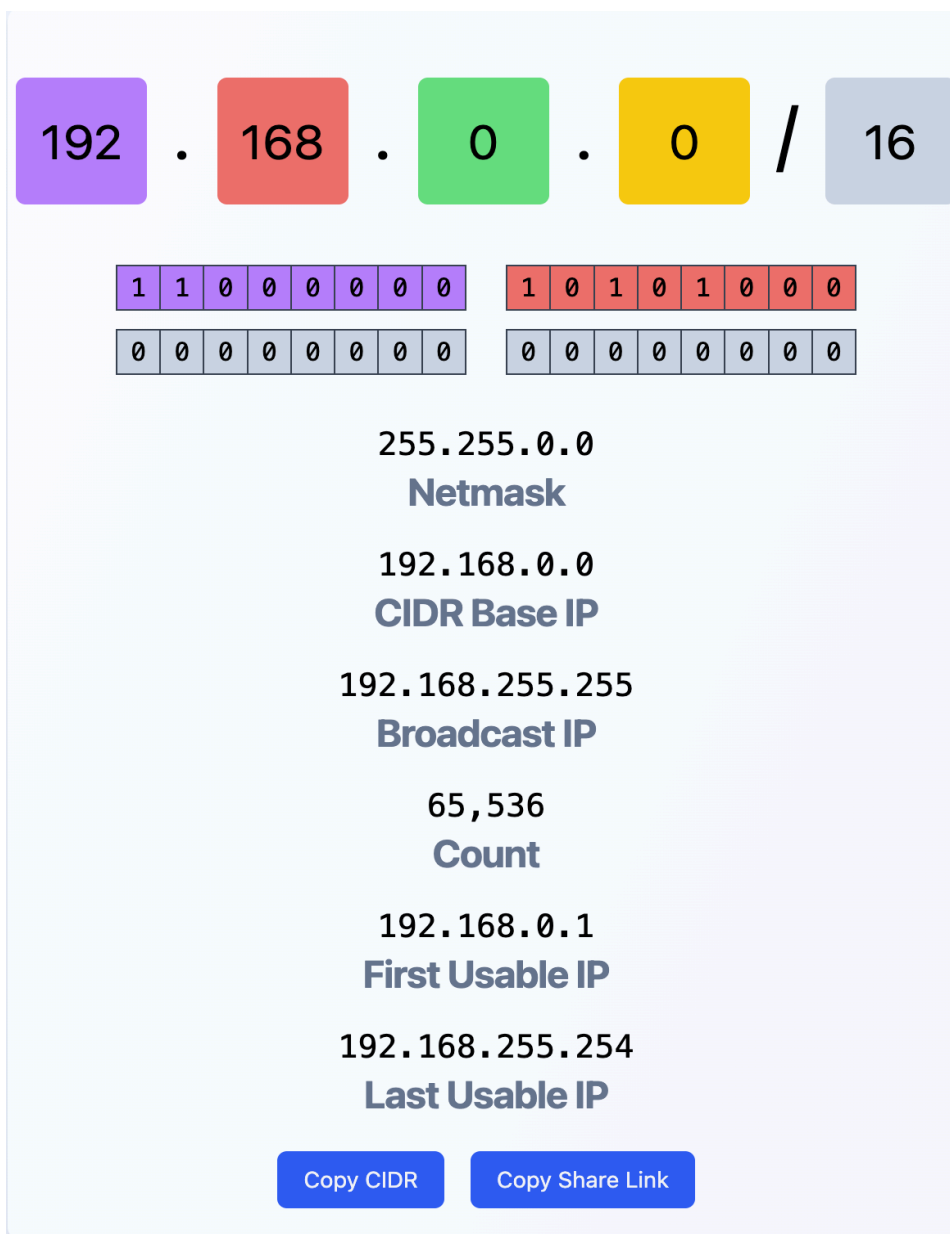

VPC (Virtual Private Cloud) : Networking Service in AWS

- VPC is a Network Boundary.
- Nothing but Secure and isolated network segment within AWS.
- In simple terms VPC is own private network in the cloud
- Every network has unique IP address.
- To create VPC we should create VPC in a region.
- If we create any resources (services) in one VPC they can't communicate with resources which are in other VPC. But we can manually setup to make them communicate.
- For every VPC there will be range of IP addresses (CIDR - Classless Inter Domain Routing - It gives range of IP addresses)

CIDR:

Website: [CIDR.xyz](https://cidr.xyz)

- Classless Inter-Domain Routing (CIDR) is a compact way to write IP address ranges and their network masks.

192 . 168 . 0 . 0 / 16

1	1	0	0	0	0	0	0
0	0	0	0	0	0	0	0

1	0	1	0	1	0	0	0
0	0	0	0	0	0	0	0

255.255.0.0
Netmask

192.168.0.0
CIDR Base IP

192.168.255.255
Broadcast IP

65,536
Count

192.168.0.1
First Usable IP

192.168.255.254
Last Usable IP

[Copy CIDR](#) [Copy Share Link](#)

- If we see above number 192.168.0.0/16 – it represents ip address (4 bytes - 32 bit)
- To calculate CIDR => 2^{32-n} Here n is 16
- In real time we mostly use /16 or /28

/31	$\rightarrow 32 - 31 = 1 \rightarrow 2^1 \rightarrow 2$	ip addresses

Class	
/8	$\rightarrow A$
/16	$\rightarrow \text{class B}$
/24	$\rightarrow \text{class C}$

What is RFC (Request for Comments) 1918?

RFC 1918 is a standard by the **IETF** that defines **private IPv4 address ranges**. These addresses are **not routable on the public Internet** and are intended for use within **private networks**.

Purpose

- Provides **IP address space** for internal use (e.g., corporate LANs, cloud networks, home routers).
- Helps avoid IP address exhaustion by **reusing** the same ranges in different private networks.
- Supports **Network Address Translation (NAT)** to access the internet from private IPs.

Characteristics

- **Not routable** on the public Internet
- Can be used **freely** without registration
- Require **NAT** to communicate with external/public networks
- Often used in **VPNs, cloud VPCs, and internal company networks**

RFC 1918 in AWS

- AWS VPCs commonly use RFC 1918 address ranges.
- Examples:
 - **10.0.0.0/16** for a custom VPC
 - **172.31.0.0/16** is default for AWS default VPCs
 - 192.168.0.0/16 supported but its not used by default
 - NAT Gateways or NAT Instances used for outbound internet access

RFC Ranges :

- **10.0.0.0/8**: This range includes all IP addresses from 10.0.0.0 to 10.255.255.255.
- **172.16.0.0/12**: This range includes all IP addresses from 172.16.0.0 to 172.31.255.255.

- **192.168.0.0/16:** This range includes all IP addresses from 192.168.0.0 to 192.168.255.255.

Components in VPC:

- Subnets (Public, Private)
- Internet Gateway
- NAT Gateway (Network Address Translation)
- Security groups
- Route Tables

VPC Types:

There are two types

1. Default VPC – Which already AWS configured for us
2. Custom VPC - We configure it.
